```

By observing the QAIC (A similar measure of goodness of fit as AIC), the zero inflated negative binomial model seems to be the best fit to model the data.

By observing the type I error, we can see that the quasi poisson model has the smallest type I error. The zero inflated poisson model has the highest type I error. The zero inflated negative binomial model also has very high type I error. The negative binomial model has small type I error closed to quasi binomial model. We can conclude that zero-inflated model inflates the type I error.

Based on these information, I would conclude that using quasi-binomial model is the most ideal case among the four models. Although it has the highest QAIC, it has the smallest type I error.

To summarize the result of quasi-binomial model, we have QAIC = 392699.5 for Genus and QAIC = 574885.3 for Species. The type I error is 0.05 for Genus and 0.04 for Species.

Redo Midterm question

Question 2

1

(1) Answer:

The deviance of fitted model = 0.95443 = residual deviance

It is calculated by $2 \frac{\log L_{\Omega}}{\log L_{\omega}}$

(2) Answer:

H_0 : 2 models are not distinguishable ($\beta_1 = \beta_2 = \beta_3 = 0$)

H_A : 2 models are distinguishable (at least one $\beta_i \neq 0$)

When df = 4, the p value for critical value 0.95443 is between 0.1 and 0.9 which is greater than 0.05. Hence, we do not have enough evidence to conclude fitted model and saturated model are significantly different. Hence, the fitted model is a good fit to the data.

(3) Answer:

$$D_{null} - D_w = 21.33202 - 0.95443 = 20.37759$$

$$Df_{null} - Df_w = 7 - 4 = 3$$

According to the table of Chi-square distribution, the p-value is less than 0.001.

Hence, we conclude 3 predictors provide a significant better fit than the intercept only model.

(4) Answer:

$$\log\left(\frac{p_i}{1-p_i}\right) = -2.6163 + 0.6223sex_i + 0.6157age_i + 0.362ecg_i$$

$$\log(\text{odd}) = -2.6163 + 0.6223 + 0.6157 + 0.362 = -1.0163$$

$$\text{odd} = e^{-1.0163} \approx 0.3619$$

(5) Answer:

8 parameters in model. The deviance will be 0 since when number of parameter is equivalent to number of observation, we have a saturated model which has deviance 0.

(6) Answer:

$$\text{Hessian is } \sum_i [-(x_i^T)^T \left(\frac{1}{(1+e^{x_i^T \beta})^2} \right) (e^{x_i^T \beta}) (x_i^T)]$$

For all vectors a ,

$$\sum_i [a^T (x_i^T)^T \left(\frac{1}{(1+e^{x_i^T \beta})^2} \right) (e^{x_i^T \beta}) (x_i^T) a] = \sum_i [(x_i^T a)^T \left(\frac{e^{x_i^T \beta}}{(1+e^{x_i^T \beta})^2} \right) (x_i^T a)] = \sum_i [(x_i^T a)^2 \left(\frac{e^{x_i^T \beta}}{(1+e^{x_i^T \beta})^2} \right)]$$

Since exponential function is always positive, the Hessian matrix is positive semidefinite by Energy-based definition. Therefore, the log-likelihood function is concave.

(7) Answer:

It will be the same as binomial model since the extended bernoulli model is equivalent to the binomial mode.

Question 8

(1) Answer:

3+4=7 parameters in the model

(2) Answer:

$$\frac{1}{\exp(\theta_1 - 40\beta_{age} - \beta_{gender} - \beta_{smoke})}$$

(3) Answer:

$$\exp(-\beta_{smoke} - \beta_{npt})$$

(4) Answer:

$$\exp(\beta_{smoke} + \beta_{npt})$$

(5) Answer:

$$\exp(-\beta_{smoke} - \beta_{npt})$$
